ANALYTICAL REPORT

ASSIGNMENT DAY 31

DATA ANALYST AND BUSINESS INTELLIGENCE 22

BOOTCAMP – DIBIMBING.ID

written by:

Dita Aulia A.

INTRODUCTION

Objectives

This analysis aims to evaluate website performance and marketing campaign effectiveness using the Google Analytics 4 (GA4) Demo Account (Web Only) during January 2026. The analysis is conducted to understand trends in session and user counts, identify campaign performance based on key metrics, and provide insights and recommendations to support decision-making regarding digital marketing strategies.

Specifically, this analysis aims to:

1. Analyze session and user trends during the observation period.
2. Compare the number of new users and returning users (established users).
3. Identify the five campaigns with the highest engagement rates, bounce rates, and session key event rates.
4. Determine the top two campaigns based on a combination of performance metrics.
5. Provide insights and recommendations based on the analysis results.

Methods

The analysis was conducted using the Free Form Exploration feature in Google Analytics 4 (GA4), utilizing data from the Google Merchandise Store Demo Account (Web Only). The entire analysis covers the period from January 1, 2026, to January 31, 2026.

To analyze session and user trends, a line chart visualization was employed using the "Sessions" and "Total Users" metrics, alongside the "New/Established" dimension to distinguish between new and returning users.

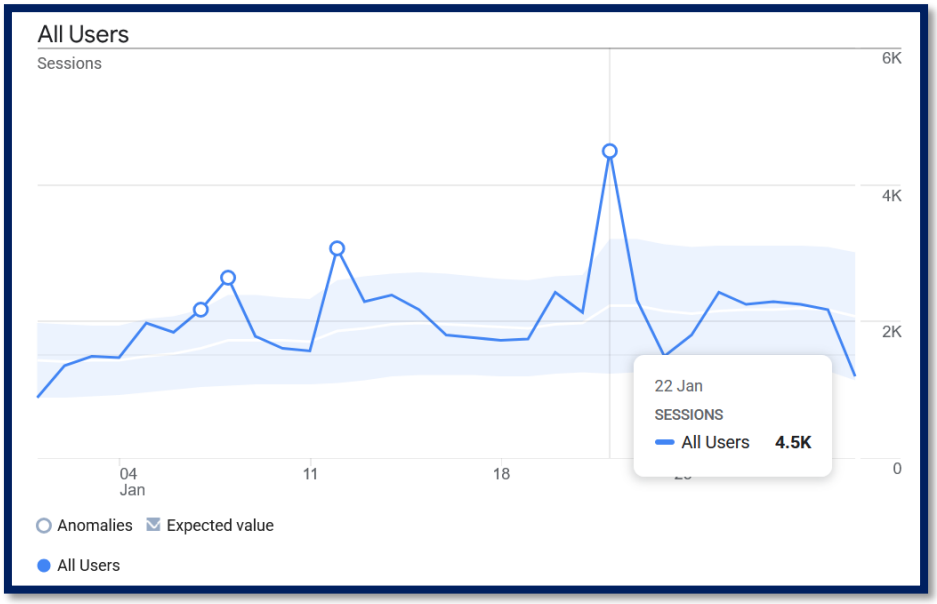

Subsequently, campaign performance was analyzed using a table visualization featuring the "Session Campaign" dimension and the metrics for Sessions, Engagement Rate, Bounce Rate, and Session Key Event Rate. Campaigns were compared across these metrics to identify the best-performing ones. During the evaluation, campaigns with very low session volumes were excluded from primary consideration to ensure the analysis results remained representative.

Based on these findings, user behavior patterns and campaign effectiveness were interpreted, leading to the formulation of recommendations to serve as a basis for improving website performance and marketing strategies.

RESULTS AND DISCUSSION

Session Trend

The session trend analysis was conducted to examine daily website traffic throughout January 2026. By analyzing the number of sessions from January 1 to January 31, 2026, the analysis aims to identify traffic patterns, significant spikes, and periods of stable website activity.

During January 2026, the number of sessions on the website remained relatively stable, ranging from approximately 1700 to 2500 sessions per day. This indicates a consistent volume of visitors. However, there were notable spikes in session counts, starts on January 7 then January 8 and 12, and culminating in a peak of around 4500 sessions on January 22. The surge on January 22 reflects an unusual increase in traffic, likely driven by a successful marketing campaign, a promotion, or a boost in traffic from social media or organic search. Subsequently, session numbers returned to normal levels, leading to the conclusion that the spike was temporary rather than a sustained increase.

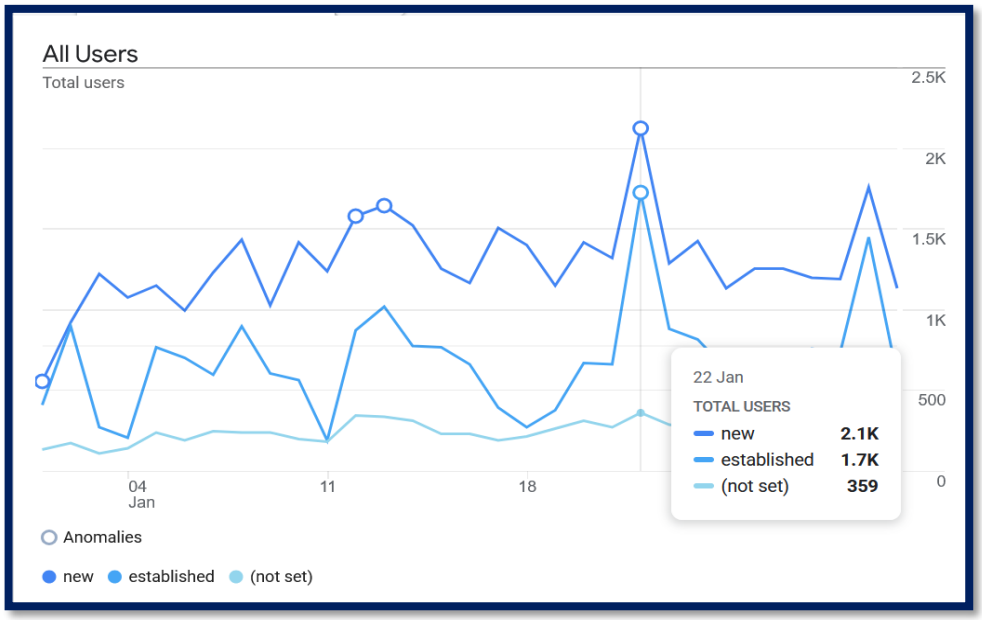

Recommendation

Further analysis is required to identify the traffic source or campaign responsible for the spike on January 22. If the surge resulted from a successful campaign, the same strategy could be applied to future campaigns. Additionally, the company must ensure that the increase in visitors is accompanied by strong engagement and conversion rates, thereby not only attracting a large volume of visitors but also delivering a positive impact on the business.

RESULTS AND DISCUSSION

Users Trend

The user trend analysis was conducted to examine changes in the number of users throughout January 2026. By analyzing the number of new users and returning (established) users from January 1 to January 31, 2026, the analysis aims to understand user acquisition and retention patterns over the observation period.

Analysis results indicate that the number of new users consistently exceeded that of returning (or established) users throughout January 2026. This suggests that the website was more successful at attracting new visitors than at retaining existing ones for repeat visits. The number of new users saw several increases during January, with the most significant rise occurring on January 22. This spike aligns with session trend analysis, leading to the conclusion that the traffic increase on that date was primarily driven by new users.

Meanwhile, the number of returning users remained relatively stable, showing no significant growth. This indicates that traffic growth was driven more by the successful acquisition of new users than by an increase in the number of users returning to the site.

Additionally, there was a small segment of users categorized as “Not Set” which are users who could not be classified by Google Analytics as either new or returning. Given their relatively small numbers, this category did not significantly impact the overall analysis results.

Recommendation

The company needs to identify the specific campaign or traffic source that drove the surge in new users on January 22. If the spike resulted from a successful campaign, that same strategy could be replicated in future campaigns.

Additionally, the company should aim to increase the number of returning users by encouraging first-time visitors to come back to the website. This can be achieved through tactics such as remarketing, personalized email marketing, loyalty programs, or regular content updates. By boosting the number of returning users, the website can build a more stable user base rather than relying solely on new visitors.

Top 5 Campaigns by Engagement Rate

The campaign engagement rate analysis was conducted to evaluate how effectively each campaign encouraged user interaction during the observation period. By comparing the engagement rate and the number of sessions for each campaign, the analysis aims to identify the top 5 campaigns that generated the highest quality traffic and successfully encouraged meaningful user engagement.

	Session campaign	Sessions	Engagement rate
	Total	63,044	55.5%
1	(cross-network)	789	90.5%
2	[Evergreen] Merch Store US and CA | Search	3,423	79.2%
3	Oct2025_Fall_V1	2,566	77.5%
4	[Evergreen] Merch Store US and CA | Performance Max	637	74.9%
5	Oct2025_Holiday_V1	166	74.7%

Analysis results indicate that the (cross-network) campaign achieved the highest engagement rate (90.5%) with 789 sessions, demonstrating its success in attracting visitors who actively interacted with the website.

In second place was the [Evergreen] Merch Store US and CA | Search campaign, with an engagement rate of 79.2% and 3,423 sessions. Although its engagement rate was lower, this campaign generated a significantly higher volume of visitors, thereby delivering a greater overall impact.

Meanwhile, Oct2025_Fall_V1, [Evergreen] Merch Store US and CA | Performance Max, and Oct2025_Holiday_V1 also recorded high engagement rates—exceeding 74%. However, the latter two campaigns had fewer sessions, meaning their reach remained limited.

Recommendation

The company should maintain and develop the (cross-network) campaign and the [Evergreen] Merch Store US and CA | Search campaign, as both have demonstrated strong performance in driving user interaction with the website.

For campaigns with low session counts, the company could expand the target audience or optimize promotional strategies to reach more users without compromising engagement quality. Furthermore, strategies from successful campaigns can serve as a benchmark to improve the performance of other campaigns.

Top 5 Campaigns by Bouncing Rate

The campaign bounce rate analysis was conducted to evaluate the percentage of users who left the website without meaningful engagement during the observation period. By comparing the bounce rate and the number of sessions for each campaign, the analysis aims to identify campaigns that require further optimization.

	Session campaign	Sessions	↓ Bounce rate
	Total	55,941	38.2%
1	[Bug: 473915186] Search - Google Ads (2)	58	56.9%
2	[Bug: 473915186] Search - Google Ads (1)	27	44.4%
3	(direct)	23,338	43.3%
4	[Experiment Bug: 437943621] Merch Store US and CA | Search [Do not Edit]	199	41.7%
5	(organic)	19,358	37.6%

Analysis results indicate that [Bug: 473915186] Search - Google Ads (2) has the highest bounce rate (56.9%) with 58 sessions. This means that more than half of the visitors left the website without engaging in meaningful interaction.

The second position is held by [Bug: 473915186] Search - Google Ads (1), with a bounce rate of 44.4% and 27 sessions. However, given the relatively low number of sessions, this result should be interpreted with caution.

Among campaigns with a high volume of sessions, (direct) shows a bounce rate of 43.3% across 23,338 sessions. This indicates that a significant number of visitors arrive at the website directly but do not proceed to interact further. Meanwhile, (organic) has the lowest bounce rate (37.6%) among the top five campaigns, despite generating 19,358 sessions. This suggests that visitors coming from organic search tend to be more interested and engage more actively with the website.

Recommendation

The campaigns with high bounce rates should be reviewed to identify potential issues with audience targeting, ad messaging, or landing page relevance. In particular, the Google Ads campaigns may benefit from optimizing keywords, refining audience targeting, and improving landing page content to better align with user expectations. Meanwhile, the relatively lower bounce rate of organic traffic suggests that SEO-driven visitors are more engaged. The organization should continue investing in high-quality content and search engine optimization while applying similar content and landing page strategies to paid campaigns to improve overall user engagement.

Top 5 Campaigns by Session Key Event Rate

The campaign conversion rate analysis was conducted to evaluate how effectively each campaign encouraged users to complete key events during the observation period. By comparing the session key event rate and the number of sessions for each campaign, the analysis aims to identify the campaigns that generated the best conversion performance.

	Session campaign	Sessions	Session key event rate
	Total	63,044	24.5%
1	(cross-network)	789	50.6%
2	[Evergreen] Merch Store US and CA | Performance Max	637	40.5%
3	[Evergreen] Merch Store US and CA | Search	3,423	38.7%
4	Oct2025_Holiday_V1	166	37.3%
5	Oct2025_Fall_V1	2,566	37.0%

RESULT AND DISCUSSION

Analysis results indicate that (cross-network) achieved the highest session key event rate (50.6%) with 789 sessions. This demonstrates that the campaign was highly effective in driving users to complete key events, such as purchases or other significant actions. The second spot was held by [Evergreen] Merch Store US and CA | Performance Max, with a session key event rate of 40.5% and 637 sessions. Although it attracted fewer visitors than other campaigns, it still managed to generate a high conversion rate.

Meanwhile, [Evergreen] Merch Store US and CA | Search ranked third with a session key event rate of 38.7% and generated 3423 sessions, the highest volume among the top five campaigns. This shows that the campaign not only succeeded in attracting a large number of visitors but also effectively drove them to complete key events.

Oct2025_Holiday_V1 and Oct2025_Fall_V1 also demonstrated strong conversion performance, with rates of 37.3% and 37.0%, respectively. However, Oct2025_Fall_V1 recorded a significantly higher number of sessions, making its results more representative.

Recommendation

The company should maintain and develop both cross-network and evergreen campaigns, as both yield high conversion rates. In particular, the "[Evergreen] Merch Store US and CA | Search" campaign warrants prioritization, as it generates the highest volume of visitors while also delivering strong conversion rates.

Furthermore, the company can analyze the strategies employed in these campaigns such as target audiences, ad creative, and landing pages and apply them to other campaigns to boost conversion performance.

RESULT AND DISCUSSION

Top 2 Campaigns

Before deciding which are the top two campaigns based on a combination of performance metrics, it would be easier if put all metrics all together.

	Session campaign	Sessions	Engagement rate ↓	Bounce rate	Session key event rate
	Total	55,941	61.8%	38.2%	25.5%
1	(cross-network)	789	90.5%	9.5%	50.6%
2	[Evergreen] Merch Store US and CA | Search	3,423	79.2%	20.8%	38.7%
3	Oct2025_Fall_V1	2,566	77.5%	22.5%	37.0%
4	[Evergreen] Merch Store US and CA | Performance Max	637	74.9%	25.1%	40.5%
5	Oct2025_Holiday_V1	166	74.7%	25.3%	37.3%

Pict 1. Top 5 by Engagement Rate

	Session campaign	Sessions	Engagement rate	Bounce rate ↓	Session key event rate
	Total	55,941	61.8%	38.2%	25.5%
1	[Bug: 473915186] Search - Google Ads (2)	58	43.1%	56.9%	13.8%
2	[Bug: 473915186] Search - Google Ads (1)	27	55.6%	44.4%	7.4%
3	(direct)	23,338	56.7%	43.3%	22.4%
4	[Experiment Bug: 437943621] Merch Store US and CA | Search [Do not Edit]	199	58.3%	41.7%	16.6%
5	(organic)	19,358	62.4%	37.6%	23.8%

Pict 2. Top 5 by Bounce Rate

	Session campaign ↓	Sessions	Engagement rate	Bounce rate	Session key event rate ↓
	Total	55,941	61.8%	38.2%	25.5%
1	(cross-network)	789	90.5%	9.5%	50.6%
2	[Evergreen] Merch Store US and CA | Performance Max	637	74.9%	25.1%	40.5%
3	[Evergreen] Merch Store US and CA | Search	3,423	79.2%	20.8%	38.7%
4	Oct2025_Holiday_V1	166	74.7%	25.3%	37.3%
5	Oct2025_Fall_V1	2,566	77.5%	22.5%	37.0%

Pict 3. Top 5 by Session Key Event Rate

RESULT AND DISCUSSION

The selection was based on a combination of four factors: session volume, engagement rate, bounce rate, and session key event rate. Campaigns with a larger number of sessions provide more reliable performance metrics, while high engagement, low bounce, and high key event rates indicate better user quality and stronger campaign effectiveness.

Top Two Campaigns

1. Cross-Network

This campaign delivered the strongest overall performance across all three metrics. It achieved the highest engagement rate (90.5%), the lowest bounce rate (9.5%), and the highest session key event rate (50.6%). These results indicate that users acquired through this campaign were highly engaged and were more likely to complete key events compared with users from other campaigns.

Although the campaign generated fewer sessions (789) than some other campaigns, its traffic volume is still sufficiently large to make the performance metrics meaningful.

2. [Evergreen] Merch Store US and CA | Search

This campaign generated the highest number of sessions (3,423) among the top-performing campaigns while maintaining excellent performance across all key metrics. It recorded a 79.2% engagement rate, a relatively low bounce rate of 20.8%, and a 38.7% key event rate.

Although its engagement and conversion rates are slightly lower than those of *(cross-network)*, the substantially larger traffic volume makes this campaign highly valuable from a business perspective. It successfully combines strong user engagement with broad audience reach.

Recommendation

The organization should continue investing in (cross-network) and [Evergreen] Merch Store US and CA | Search, as both campaigns consistently performed well across engagement, bounce, and conversion metrics. The (cross-network) campaign can serve as a benchmark for audience targeting and campaign optimization due to its exceptional user quality. Meanwhile, the Evergreen Search campaign should be prioritized for scaling because it successfully combines strong engagement with the highest traffic volume, maximizing its overall business impact. Additionally, the marketing team should analyze the strategies used in these campaigns—including targeting, messaging, and landing page design—and apply the best practices to lower-performing campaigns to improve their effectiveness.

REFLECTION QUESTIONS

1) *Mengapa custom reporting diperlukan dalam analisis tren pengguna, dibandingkan hanya mengandalkan laporan standar dari tools analytics? Jelaskan bagaimana custom reporting membantu menjawab kebutuhan bisnis yang lebih spesifik.*

Custom reporting is necessary because standard reports only provide predefined metrics and dimensions, which may not fully address specific business questions. While standard reports offer a general overview of website performance, they have limited flexibility for analyzing data from different perspectives.

Custom reporting allows analysts to select relevant dimensions, metrics, filters, and visualizations based on business needs. For example, businesses can analyze session trends, compare new and returning users, or evaluate campaign performance using engagement rate, bounce rate, and conversion rate in a single report.

So by creating customized reports, organizations can gain deeper insights into user behavior, identify high-performing marketing campaigns, and make more informed, data-driven decisions that support their business objectives.

2) *Bagaimana perbedaan metrik (engagement rate, bounce rate, dan conversion rate) memengaruhi cara kamu menilai keberhasilan sebuah campaign? Menurutmu, mengapa campaign dengan engagement tinggi belum tentu memiliki conversion yang baik?*

Engagement rate, bounce rate, and conversion rate serve distinct functions in evaluating the success of a campaign; therefore, these three metrics should be evaluated together rather than individually.

- Engagement rate indicates how actively users interact with a website after arriving via a campaign. A higher engagement rate suggests the website is more compelling and relevant to visitors.
- Bounce rate represents the percentage of visitors who leave the site without engaging in any meaningful way; a high bounce rate implies a greater likelihood that the website or landing page fails to meet visitor expectations.
- Session key event rate measures the proportion of users who successfully complete a desired action such as purchasing a product, filling out a form, or triggering another key event, thereby indicating the campaign's effectiveness in achieving business goals.

A campaign with a high engagement rate does not necessarily have a high conversion rate because users may enjoy browsing the website without taking the desired action. For example, visitors may read product information, view multiple pages, or watch videos but leave without making a purchase or submitting a form. This can happen if the pricing is not attractive, the checkout process is complicated, or the call-to-action is unclear. Therefore, a successful campaign should not only engage users but also encourage them to complete the desired conversion.
